Application: Wherever Deep Cycle 6-volt batteries are needed.

Type: Flooded Lead Acid (FLA) non-sealed.

Case material: Polypropylene / Heat Sealed

CHARGING INSTRUCTIONS:

Following is the charging recommendation and charging profile using 2 stage chargers for US Battery deep cycle products.

*Equalization and float charge modes are not considered to be one of the stages in a charging profile.

1. **Bulk Charge**
   - Constant current @~10% of C/20 Ah in amps to 2.45 +/- 0.05 volts per cell
   - (e.g. 7.35 volts +/- 0.15 volts per 6 volt battery)

2. **Absorption Charge**
   - Constant voltage (2.45 +/- 0.05 vpc) to 3% of C/20 Ah in amps then hold for 2-3 hours and terminate charge
   - Charge termination can be by maximum time (2-4 hr) or dV/dt (4 mv/cell per hour)

   **(Optional Float Charge)**
   - Constant voltage 2.17 vpc (6.51 volts per 6 volt battery) for unlimited time

   **Equalization Charge**
   - Constant voltage (2.55 +/- 0.05 vpc) extended for 1-3 hours after normal charge cycle (repeat every 30 days)

   **Notes:**
   - Charge time from full discharge is 9-12 hours.
   - Absorption charge time is determined by the battery but will usually be ~3 hours at 2.45 volts per cell.
   - Float time is unlimited at 2.17 volts per cell.
   - Specific gravity at full charge is 1.270 minimum

Battery temperature adjustment: reduce the voltage by 0.028 Volts per cell for every 10°F above 80°F, increase by the same amount for temperatures below 80°F.

Deep cycle batteries need to be equalized periodically. Equalizing is an extended, low current charge performed after the normal charge cycle. This extra charge helps keep all cells in balance. Actively used batteries should be equalized once per month.

Manually timed chargers should have the charge time extended approximately 3 hours.

Automatically controlled chargers should be unplugged and reconnected after completing a charge.

Note: The use of flanged nuts and other types of nuts with captive washers or other hardware not listed above is not recommended by US Battery and their use may void the battery warranty.

U.S. Battery Operating Temperature Guidelines

For charging, we recommend staying within 0°F to 120°F (-18 to 49°C) to avoid charging frozen batteries at low temperature or going into thermal runaway at high temperature.

For discharging, we recommend -20°F to 120°F (-29 to 49°C). Batteries discharged at temperatures below 32°F (0°C) should be recharged immediately to avoid freezing. Batteries discharged at temperatures above 120°F (49°C) should be allowed to cool before recharging.

Extreme temperatures can substantially affect battery performance and charging. Cold reduces battery capacity and retards charging. Heat increases water usage and can result in overcharging. Very high temperatures can cause “thermal runaway” which may lead to an explosion or fire. If extreme temperature is an unavoidable part of an application, consult a battery/charger specialist about ways to deal with the problem.
